Indexing Drives
Servo Motors*

EAS[®]-NC

Backlash-free Safety Clutch

- *Indicating torque adjustment*
- *Easy assembly*
- *Hardened functional components*
- *Synchronous and Ratchetting design*

EAS[®]-NC Clutches optimum overload protection for your machinery.

EAS[®]-NC Torque Limiting Clutches guarantee economic protection and reliable operation, in order to maximise utilisation of machinery and equipment.

The continually increasing electric requirements in the power transmission for dynamics, higher speeds and accuracy can be met by using EAS[®]-NC Clutches.

With its optimum design principles and simple mechanics, EAS[®]-NC Clutches can withstand the extreme operating conditions. EAS[®]-NC Clutches provide zero backlash torque transmission characteristics and limit the transmitted torque exactly to a pre-set value.

In case an overload condition occurs in the drive train, due to a blockage or collision for example, the clutch will disengage, disconnecting input and output, thus uncoupling up to 90 % of the damaging energy in the system, which, if not disconnected, would cause costly damage and down-time to the machine.

Advantages for your application

The EAS[®]-NC Torque Limiting Clutch is the ideal overload protection for your machine:

- Precise torque limitation prevents costly downtime and repairs in the event of an overload.
- Backlash-free torque transmission guarantees the highest drive accuracy and service life.
- Backlash-free function remains throughout the machine's life.
- High speed and high acceleration obtained through low inertia design.
- Immediate disconnection of input and output drive components prevents costly machine damage.
- The versatility of the design ensures a suitable solution for every application.
- Graduated torque setting eliminates operating errors.
- Low operating expenses through a maintenance-free principle.
- Immediate readiness for use after an overload has occurred, minimising machine downtime.

EAS[®]-NC Lastic Backlash-free version in a directly driven servo axis. This combination limits the torque precisely to the pre-set value, compensates for shaft misalignments and damps critical vibrations.

Fast mechanical torque limiting even with electronic current monitoring systems.

Although most modern electronic systems are used for control and monitoring, blockages and collisions cannot be completely prevented. False initial start programming errors or operating errors outwit the most sophisticated control concepts. Modern electronic controls are designed with an excess-current release, which should prevent damage due to operating errors.

This type of overload protection has a considerable disadvantage which can be compensated for by a fast mechanical torque limiting safety clutch. Valuable time is lost between collision occurring until the drive motor or equipment is switched off. If a blockage occurs in the drive line the torque increases together with the motor current, and the whole drive system becomes tensioned. This overload situation can cause acute instantaneous damage before the control system registers the current rise and switches off the drive.

This gives the EAS-NC[®] Torque Limiting Clutch with its mechanical overload protection a decisive advantage. The damaging kinetic energies are uncoupled and released already within a few milliseconds and, as a limit switch can detect the disengaging movement of the clutch, a signal can be used to completely stop the machine or equipment.

Quality, Experience, Competence

Mayr Power Transmission have applied the highest technical and innovative standard for decades. The foundation for this success are the skills, productivity and quality consciousness of all Mayr employees.

The DIN ISO 9001 certification achieved confirms the high demands we set to ourselves.

Mayr Power Transmission offers you comprehensive

depth of experience, together with total engineering integrity, and quality production and management to ensure your confidence.

Many year's in-depth expertise, gained in both mechanical and electrical power transmission, confirms our position as leaders in this field.

Further products in the EAS®-programme:

EAS®-standard

These torque limiting clutches are available as ratcheting, synchronous, overload and synchronous/overload units together with a non-disengaging torque sensor design. Due to the unit construction of these clutches many variations per size, type and design can be selected to suit all applications.

EAS®-Sp / EAS®-Sm / EAS®-Zr

Pneumatically or electromagnetically controlled torque limiting clutches with a complete disengage, remote-control on-off clutching function. Torque adjustable to suit varied operating conditions.

EAS® overload / EAS®-element

EAS®-element based overload clutches for high torque applications (0,25–190 kNm). Basic elements can be integrated into existing constructions and offer flexibility of design to suit specific applications.

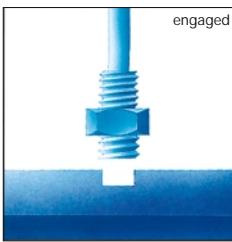

EAS®-axial

Linear motion overload protection. Tensile and compressive forces monitored via unique compact mechanical element. Eight sizes cover forces between 50 an 300 000 N in 12 variations in type and design.

Indicated torque adjustment

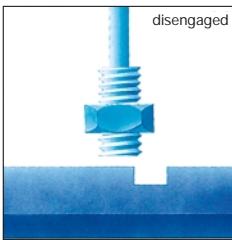

- The torque can be adjusted sensitively and accurately indicated by the fine pitch threaded graduated adjusting nut.
- The positive locking of the adjusting nut protects against self-acting unintended adjustment of the pre-set limiting torque. For the NC-sizes 4 to 6 there is an additional mechanical lock and back drive locking.

Limit switch

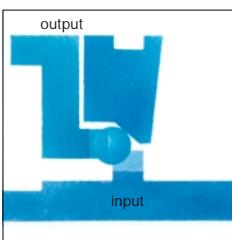

- Extreme short switch-off times
- Precise connection and axial point adjustment

Signal usage

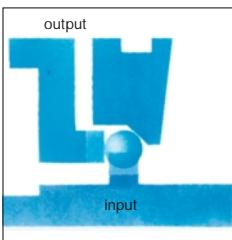

- In the event of an overload the limit switch detects the axial disengaging movement of the thrust ring quickly and precisely.
- The limit switch gives a signal for switching off the drive or other control function.

engaged

disengaged

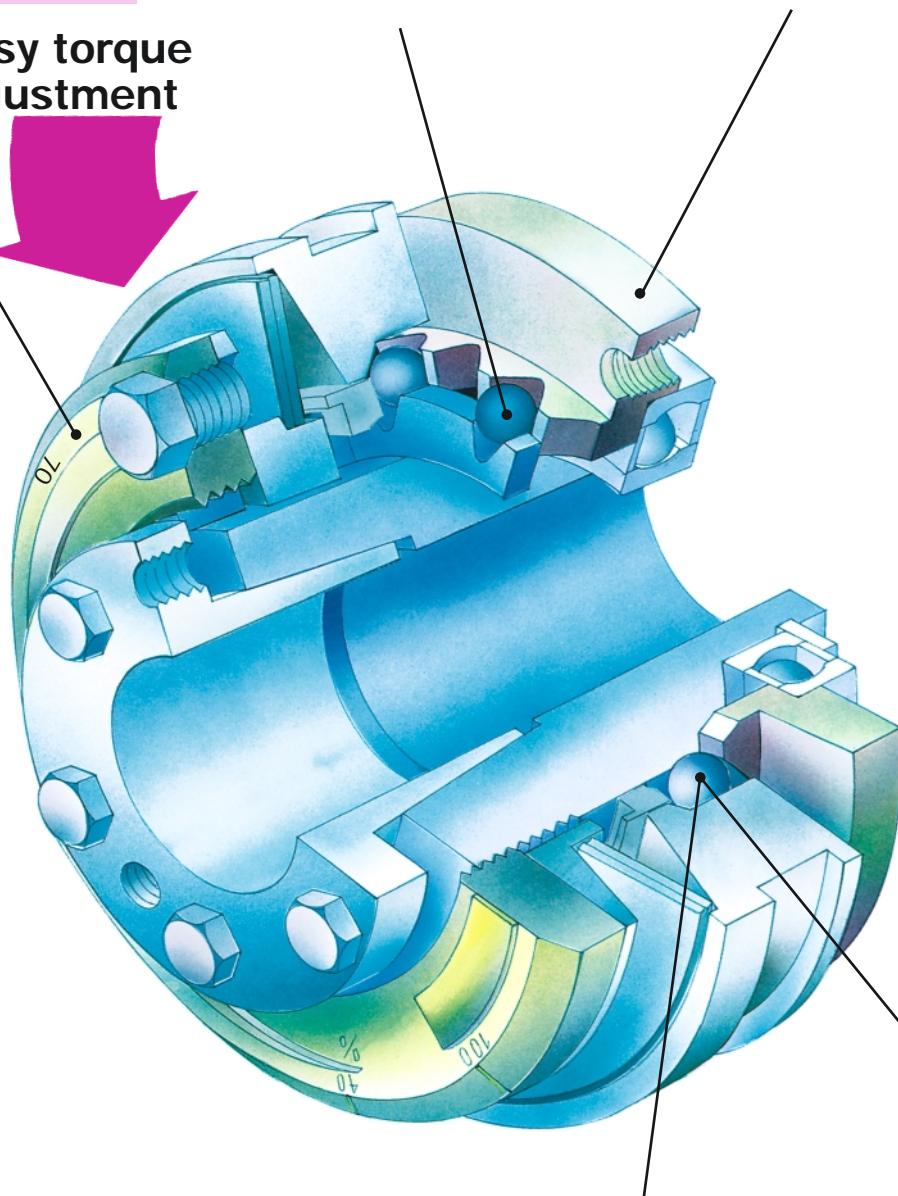

Easy torque adjustment

Torque limitation

- Adjustable torques are transmitted via balls placed in two geometrical defined seats from hub to pressure flange.
- The balls ratchet out of seats when the pre-set limiting torque is exceeded.

Pressure flange

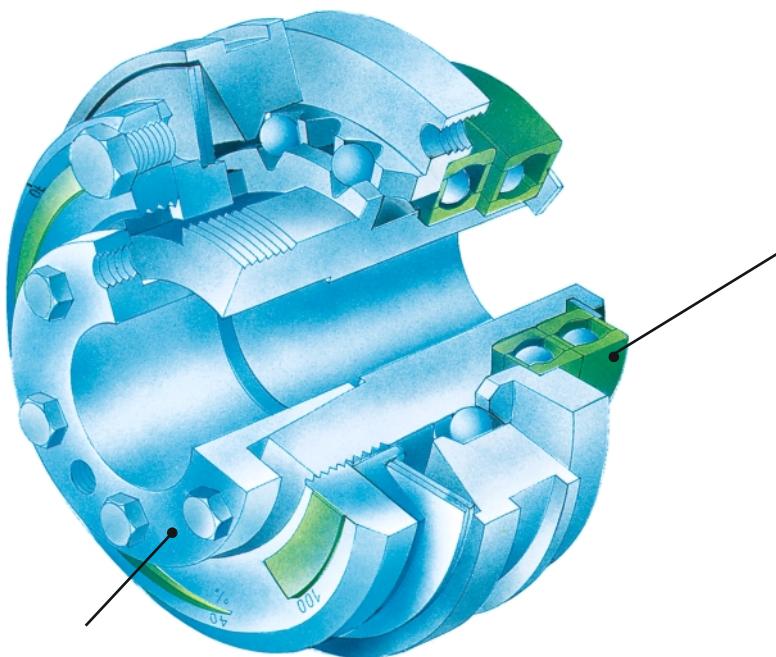

- Axially and radially supported by a deep groove ball bearing.
- Precise connection and axial location of the drive element.

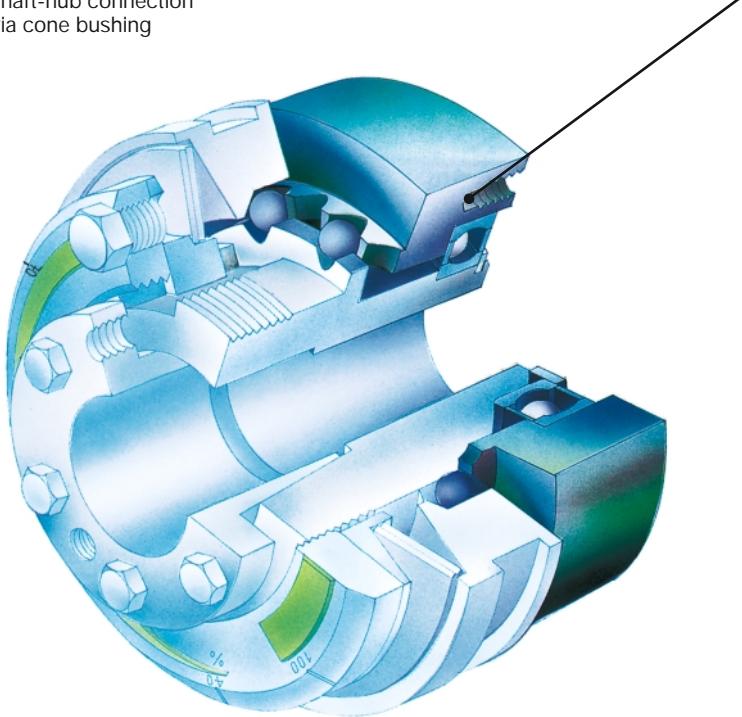

The patented backlash-free principle

The backlash-free torque transmission

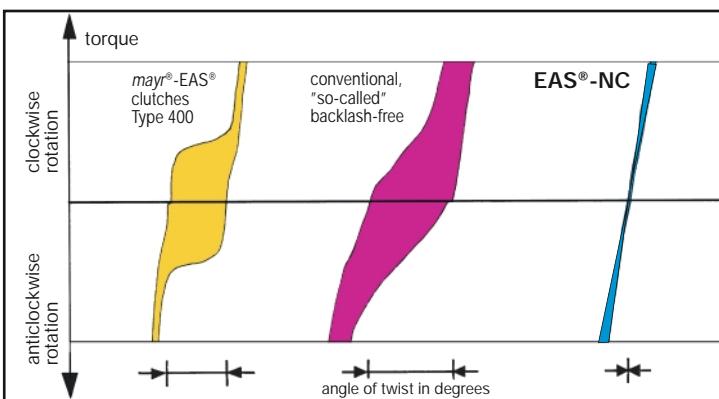

- Balls located in **radially and axially arranged recesses** on the hub and pressure flange.
- The balls are pressed by the thrust ring **simultaneously into the recesses of the hub and pressure flange** and, therefore, transmit the torque backlash-free in both directions of rotation, even with reversing direction of rotation.
- Consistent and precise torque decrease in the event of an overload due to *mayr*[®] cup springs with degressive spring characteristic.

Backlash-free
shaft-hub connection
via cone bushing

EAS®-NC - the backlash-free principle

EAS®-NC variations

EAS®-NC Type 450

Design .2

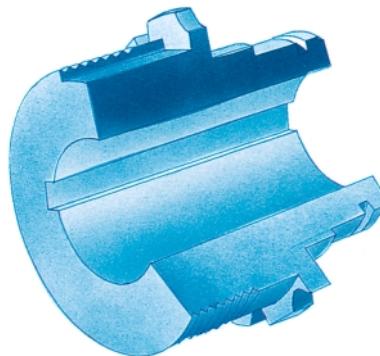

Clutch with special hub variations for fitting of wide drive elements to customer requirements.

- Stable double bearing
- Ready for attachment
- High degree of true running accuracy

EAS®-NC Type 451

The EAS®-NC principle with the mounting dimensions of our well proven EAS®-Type series 400.

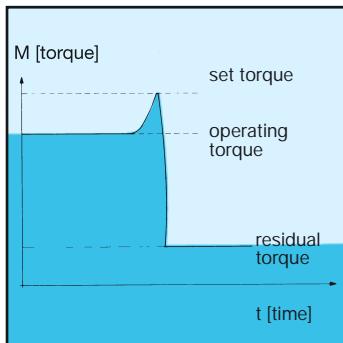

- Backlash-free
- Roller bearing in the pressure flange
- High degree of switching-off accuracy
- Degrade spring characteristic

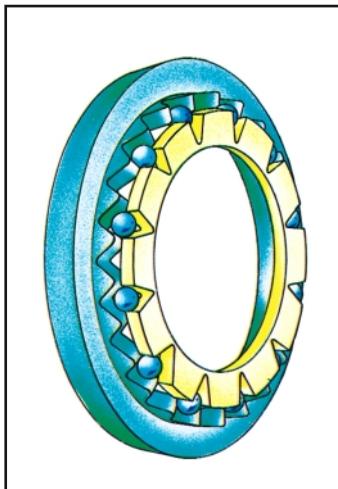

EAS®-NC hub with positive shaft-hub connection

Backlash is:

- The angular tolerance between input and output clutch components.
- Also known as circumferential backlash.
- Not to be mistaken for transmitting backlash from shaft to hub.
- With mayr® backlash-free means:**
backlash → 0
(see graph).

Switching behaviour

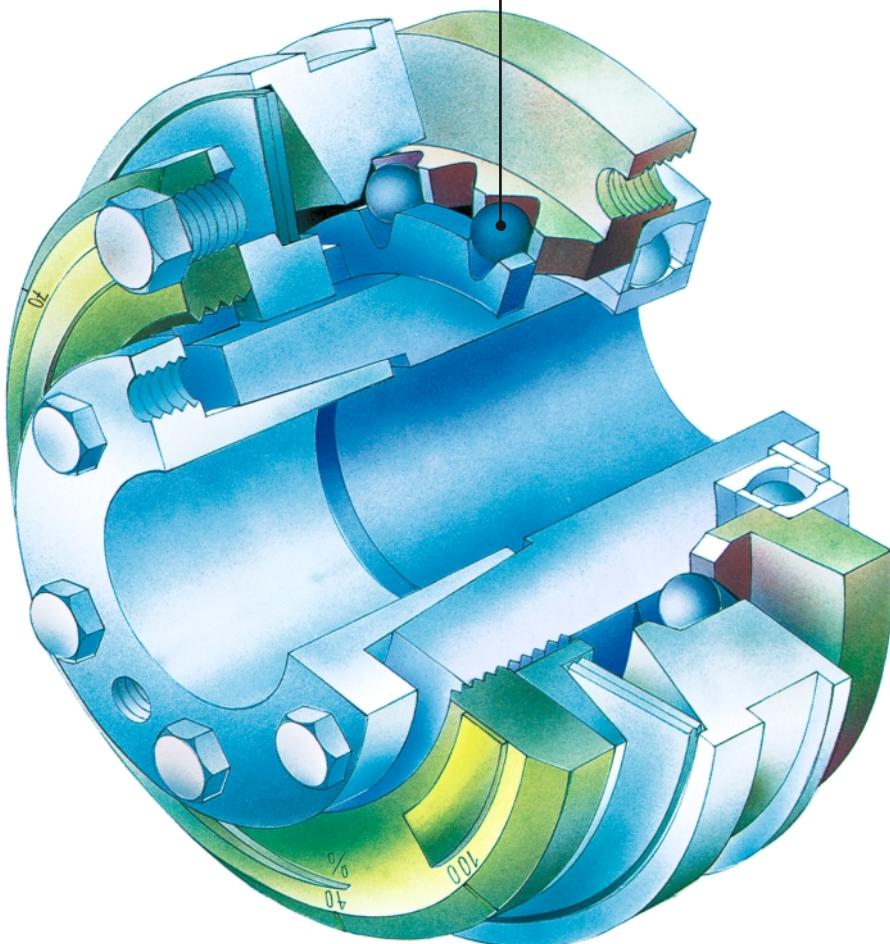

Operating principle of the mayr[®]-EAS[®]-NC ratchetting clutch

- When the pre-set limiting torque is achieved, the torque drops immediately.
- The EAS[®]-NC ratchetting clutch ratchets and re-engages automatically at the next convenient ball detent after removal of the overload.
- The *mayr*[®] limit switch switches off the drive immediately
- or makes another control function.

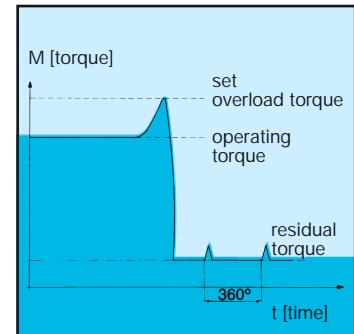

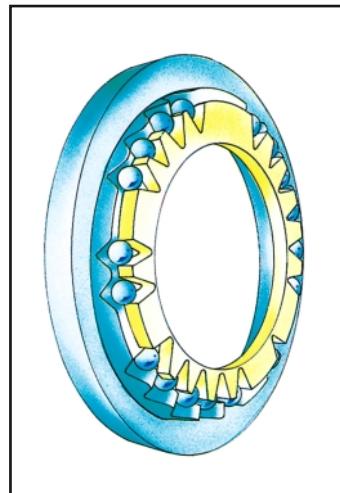

The backlash-free torque transmitting safety clutch

- Uniform and constant torque transmission due to precision manufacture of the ball detents.
- Clean and precise torque adjustment due to graduated, readable adjusting nut.
- In the event of an overload:
 - * rapid torque decrease
 - * signal for equipment control
- The EAS[®]-NC ratchetting clutch guarantees an immediate readiness for operation of the machine and equipment after removal of the overload.
- Reliable collision protection e.g. in feed drives of machine tools.

Operating principle of the *mayr*®-EAS®-NC synchronous clutch

- The EAS®-NC synchronous clutch disengages when the pre-set limiting torque is achieved.
- After removal of the overload the clutch re-engages automatically synchronously at 360°. Other cycles, for example 180°, are also available.

switching behaviour

- Re-engagement is only guaranteed at a certain position due to the special *mayr*® synchronous geometry of the *mayr*®-precision balls and ball detents.
- Uniform and constant torque transmission.
- Versatile tuning controls for cycles are possible, for example
 - * transfer points
 - * feed systems
 - * handling systems.
- Clean and precise torque adjustment due to graduated, readable adjusting nut.
- In the event of an overload:
 - * immediate torque reduction
 - * control signal
 - * synchronous re-engagement
 - * reliable collision and overload protection

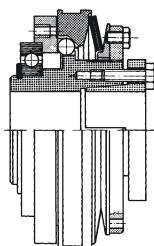

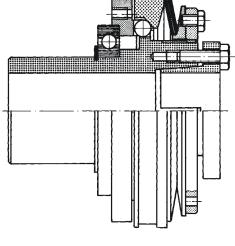

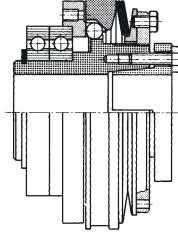

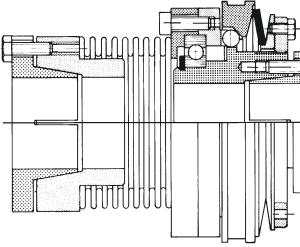

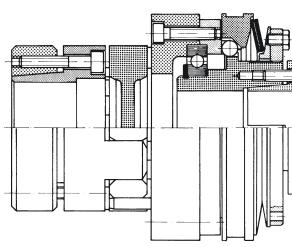

mayr®-EAS®-NC safety clutch in machines and equipment

- reduces downtimes
- increases availability
- increases productivity

a safety advantage for

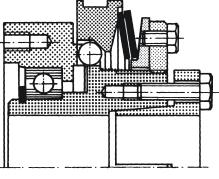

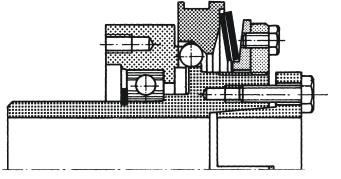

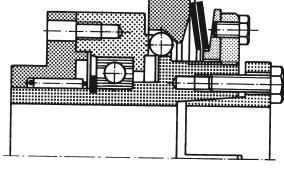

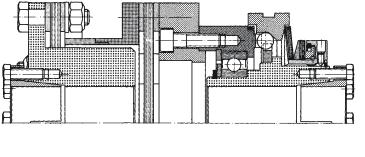

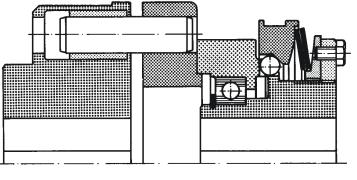

- ... persons
- ... machines
- ... controls

Summary of types

EAS [®] -NC clutch	Type Size	Torque [Nm]	Application
EAS[®]-NC standard 	450_____.0 Sizes 03 – 3	0,65 – 450	Flanged torque limiting clutch backlash-free torque transmission between shaft and drive element. The torque is transmitted backlash-free until disengagement and reduces immediately when an overload occurs. Low mass moment of inertia. Automatic re-engagement. Long working life.
EAS[®]-NC long projecting hub 	450_____.1 Sizes 03 – 3	0,65 – 450	Flanged torque clutch for backlash-free torque transmission between shaft and drive element. The torque is transmitted backlash-free until disengagement and reduces immediately when an overload occurs. Additional location of wide drive elements on a long hub through roll and slide bearing is possible. Low mass moment of inertia. Automatic re-engagement. Long working life.
EAS[®]-NC two-bearings design 	450_____.2 Sizes 03 – 3	0,65 – 450	Flanged torque limiting clutch for backlash-free torque transmission between shaft and drive element. The torque is transmitted backlash-free until disengagement and reduces immediately when an overload occurs. EAS [®] -NC two-bearings version for direct stable location of the drive elements on the clutch. Low mass moment of inertia. Automatic re-engagement. Long working life.
EAS[®]-NC with steel bellows coupling 	453_____.0 Sizes 03 – 3	0,65 – 450	Torque limiting clutch for backlash-free torque transmission between two coaxial shafts. The torque is transmitted backlash-free until disengagement and reduces immediately when an overload occurs. Low mass moment of inertia. Automatic re-engagement. Compensates axial, radial and angular misalignments. Long working life.
EAS[®]-NC lastic backlash-free 	454_____. Sizes 01 – 3	4 – 450,	Torque limiting clutch for flexible, backlash-free torque transmission between two coaxial shafts. The torque is transmitted backlash-free until disengagement and reduces immediately when an overload occurs. Automatic re-engagement. Compensates axial, radial and angular misalignments. High degree of damping characteristic - Long service life.

1) other sizes for lower and higher torques on request

We reserve the right to make dimensional and design alterations.

2) thrust washer without keyway, limit switch is located at the control element-front face

9) Position of the keyway to the mounting bore "s" in the pressure flange not defined.
A defined position is possible on request.

3) countersunk screw with hexagon socket DIN 7991

4) up to Ø 14 keyway to DIN 6885/1, above Ø 14 keyway to DIN 6885/3

5) up to Ø 33 keyway to DIN 6885/1, above Ø 33 keyway to DIN 6885/3

6) the dimensions A; h₁; o refer to the hub edge

7) mounting tolerance +0,1

8) fit by the user H7

Order example:

To be included when ordering, please state:	Size	Type	Bore Ø d ^{H7}	With limit switch
Order number:	4 5 0 . _ 2 _ . 1	9)	see pages 36-38

1) The transmittable torques of the flexible coupling "T_{KN}" depend on factors, as for example with temperatures, torsional stiffness etc.
 Please also see clutch design ROBA®-ES cat. K.940. or contact our company.

Furthermore, the transmittable torques of the flexible coupling depend on the bore diameter d₃, please also see Table 1 on page 32
 2) shaft fit: up to Ø 38 h₆, above Ø 38 h₈

EAS®-NC ratchetting clutch/synchronous clutch

Mounting example

Fig. 1

EAS®-NC standard

For the EAS®-NC standard the drive elements are located over the deep groove ball bearing and attached to the pressure flange. If the resulting radial force of the drive element is nearly in the middle of the ball bearing, an additional support for the drive element is not necessary.

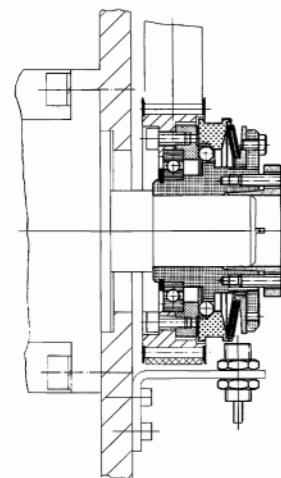

Fig. 2

EAS®-NC with long projecting hub

For very wide drive elements or for elements with very small diameters our EAS®-NC with long projecting hub is recommended. In case of small diameters the drive element is attached to the pressure flange of the clutch via an intermediate flange supplied by the customer. The support for the drive element via a ball bearing, needle bearing or slide bearing depending on the mounting situation and available space can be used.

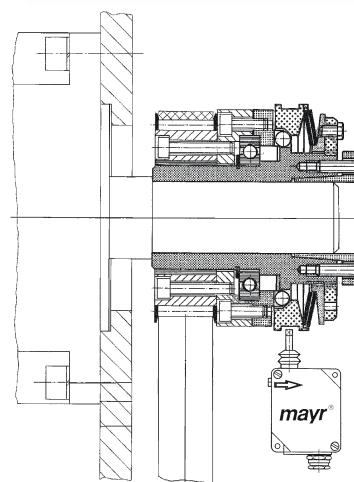

Fig. 3

EAS®-NC Type 450._1_.2

Two bearings-design for wide drive elements, whose application of force of the resulting radial force is in the middle of both bearings.

In this case the drive element can be attached directly to the pressure flange without additional support.

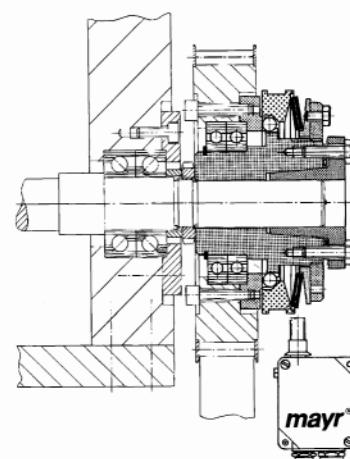

Fig. 4

EAS®-NC with steel bellows coupling

EAS®-NC with torsionally rigid flexible steel bellows coupling for connection of two shafts. The coupling compensates axial, radial and angular shaft misalignments. It is torsionally rigid in a circumferential direction. In comparison to the EAS®-NC with ROBA®-D coupling the EAS®-NC steel bellows coupling has a low mass moment of inertia.

In the mounting example shown on the right side, the EAS®-NC with steel bellows coupling is mounted between motor and ball screw spindle. The torque is transmitted backlash-free until disengagement and drops immediately after the event of an overload. The contactless limit switch (initiator) gives signal to switch off the drive.

Load torque from carriage mass with any alignment

$$M_L = \frac{m \cdot g \cdot \sin\alpha \cdot p}{2 \cdot \pi \cdot 1000} \quad [\text{Nm}] \quad (15)$$

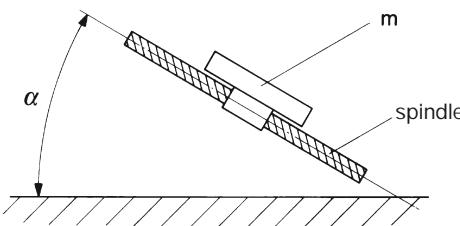

Fig. 4

Setting of the limiting torque

$$M_G = 1,5 \cdot M_1 \quad [\text{Nm}] \text{ (arrangement as shown in figure 2)} \quad (16)$$

$$M_G = 1,5 \cdot M_2 \quad [\text{Nm}] \text{ (arrangement as shown in figs. 1 + 3)}$$

M_2 from equation (4)

Condition: The disengaging torque M_A , from equation (13) or (14) must be smaller than the torque M_G adjusted at the clutch (multiplied with the factor 1,2).

M_1 [Nm]	nominal torque of the motor
M_2 [Nm]	torque on the spindle
M_B [Nm]	max. torque of the motor
M_A [Nm]	required disengaging torque in the acceleration phase
M_G [Nm]	limiting torque for an overload
M_L [Nm]	load torque from carriage mass with any alignment
g [$\frac{\text{m}}{\text{s}^2}$]	acceleration of fall
m [kg]	mass of the carriage
n_1 [rpm]	drive speed of the motor (fast motion)
n_2 [rpm]	speed of the spindle (fast motion)
p [mm]	ascent of the spindle
V [$\frac{\text{m}}{\text{s}}$]	rate of the feed of carriage
W_g [J]	total energy in the case of a collision without EAS®-NC clutch
W_2 [J]	energy in the case of a collision with EAS®-NC clutch
W_R [%]	remaining residual energy
ΔW [J]	uncoupled energy
ΔW [%]	uncoupled energy
ω_1 [s^{-1}]	angular velocity of the motor shaft
ω_2 [s^{-1}]	angular velocity of the spindle

Calculation example

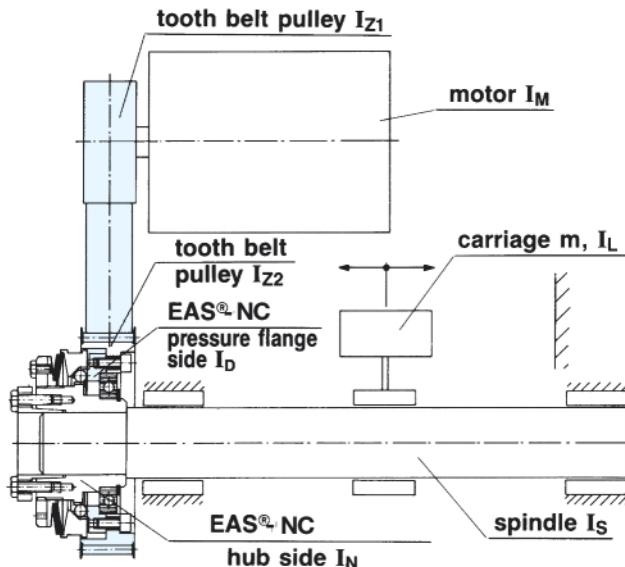

Fig. 1

Arrangement as shown in figure 1.

Indications:

mass of the carriage

$$m = 560 \text{ kg}$$

mass moment of inertia of the motor

$$I_M = 0,0037 \text{ kgm}^2$$

mass moment of inertia of the tooth belt pulleys

$$I_{Z1} = 0,0006 \text{ kgm}^2$$

mass moment of inertia of the spindle

$$I_S = 0,00067 \text{ kgm}^2$$

drive speed of the motor

$$n_1 = 2000 \text{ rpm}$$

speed of the spindle

$$n_2 = 1000 \text{ rpm}$$

ascent of the spindle

$$p = 10 \text{ mm}$$

nominal torque of the motor

$$M_1 = 14 \text{ Nm}$$

max. torque of the motor

$$M_B = 40 \text{ Nm}$$

Preselection of the clutch

$$M_{\text{req.}} = 1,5 \cdot M_2; \quad M_2 = M_1 \cdot \frac{n_1}{n_2} = 14 \text{ Nm} \cdot \frac{2000 \text{ rpm}}{1000 \text{ rpm}} = 28 \text{ Nm}$$

$$M_{\text{req.}} = 1,5 \cdot 28 \text{ Nm} = 42 \text{ Nm}$$

Selected: EAS®-NC size 1, Type 450.610.0
torque range $M_G = 30 \div 72 \text{ Nm}$
(see technical data, page 10)

Mass moment of inertia of the EAS®-NC

hub side

pressure flange side

$$I_D = 0,00039 \text{ kgm}^2$$

(see techn. data, page 10)

Rate of feed of carriage

$$v = \frac{p \cdot n_2}{6 \cdot 10^4} = \frac{10 \cdot 1000}{6 \cdot 10^4} \text{ m/s} = 0,1667 \text{ m/s}$$

Angular velocity of the motor shaft ω_1 and spindle ω_2

$$\omega_1 = \frac{n_1 \cdot \pi}{30} = \frac{2000 \cdot \pi}{30} \text{ s}^{-1} = 209 \text{ s}^{-1}$$

$$\omega_2 = \frac{n_2 \cdot \pi}{30} = \frac{1000 \cdot \pi}{30} \text{ s}^{-1} = 104,7 \text{ s}^{-1}$$

Mass of carriage reduced to the spindle

$$I_L = m \cdot \frac{v^2}{\omega_2^2} = 560 \cdot \frac{0,1667^2}{104,7^2} \text{ kgm}^2 = 0,00142 \text{ kgm}^2$$

Energy in the case of a collision without EAS®-NC clutch

$$I_g = I_M + I_{Z1} + (I_{Z2} + I_S + I_L) \cdot \left(\frac{n_2}{n_1}\right)^2 = \\ = 0,0037 + 0,0006 + (0,01132 + 0,00067 + 0,00142) \cdot \left(\frac{1000}{2000}\right)^2 = \\ = 0,00765 \text{ kgm}^2$$

$$W_g = 1/2 \cdot I_g \omega_1^2 = 1/2 \cdot 0,00765 \cdot 209^2 \text{ J} = 167 \text{ J}$$

Energy in the case of a collision with EAS®-NC clutch

$$I_2 = I_N + I_S + I_L = 0,00120 + 0,00067 + 0,00142 \text{ kgm}^2 = \\ = 0,00329 \text{ kgm}^2$$

$$W_2 = 1/2 \cdot I_2 \cdot \omega_2^2 = 1/2 \cdot 0,00329 \cdot 104,7^2 \text{ J} = 18 \text{ J}$$

Remaining residual energy

$$W_R = \frac{W_2}{W_g} \cdot 100 = \frac{18}{167} \cdot 100 = 10,8 \%$$

Uncoupled energy

$$\Delta W = W_g - W_2 = 167 \text{ J} - 18 \text{ J} = 149 \text{ J}$$

$$\Delta W = 100 - W_R = 100 - 10,8 = 89,2 \%$$

Required disengaging torque in the acceleration phase

$$I_1 = I_D + I_{Z2} + (I_{Z1} + I_M) \cdot \left(\frac{n_1}{n_2}\right)^2 = \\ = 0,00039 + 0,01132 + (0,0006 + 0,0037) \cdot \left(\frac{2000}{1000}\right)^2 = \\ = 0,0289 \text{ kgm}^2$$

$$M_A = M_B \cdot \frac{I_2}{I_2 + I_1} \cdot \frac{n_1}{n_2} = 40 \cdot \frac{0,00329}{0,00329 + 0,0289} \cdot \frac{2000}{1000} = 8,2 \text{ Nm}$$

Setting of the limiting torque

$$M_G = 1,5 \cdot M_2 = 1,5 \cdot 28 \text{ Nm} = 42 \text{ Nm}$$

The disengaging torque $1,2 \cdot M_A = 1,2 \cdot 8,2 \text{ Nm} = 9,84 \text{ Nm}$ is less than the set limiting torque $M_G = 42 \text{ Nm}$.

Technical Explanations

Indicated torque adjustment

The EAS®-NC torque limiting clutch offers the comfort of the indicated torque adjustment at the adjusting nut (not for sizes 02/03). The possibility for indication offers a substantially simplified torque adjustment and a simple monitoring of the set releasing value with an installed clutch.

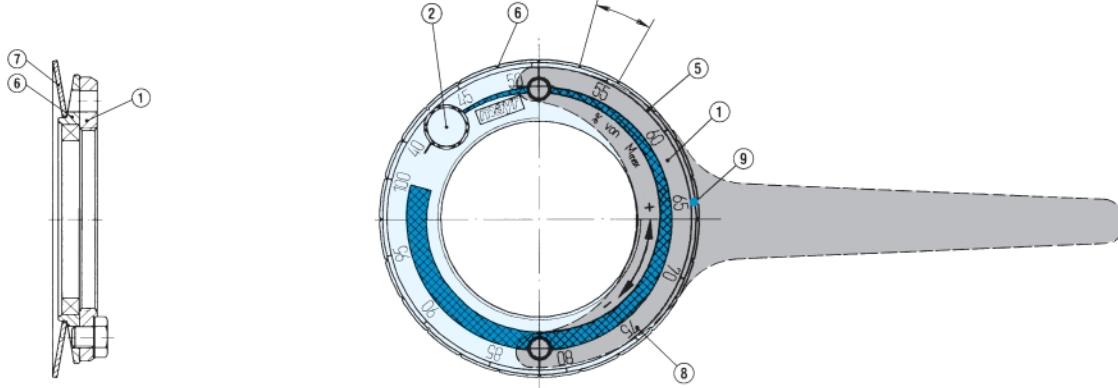

Fig. 1

Important Note!

Depending on the kind of drive and drive constellation torque peaks (e. g. due to impact of the starting torque in case of asynchronous motors, load impacts, static friction or similar) can occur in the drive shaft which are clearly over the operating torque of the equipment (motor).

The customer has to consider the behaviour for the design or adjustment of the clutch.

Torque adjustment

The adjustment is made by turning the adjusting nut. The cup springs operate in the negative area of their characteristics (see figure 2). A stronger pre-tension of the cup springs effects a decrease of the spring pressure. Turning the adjusting nut in a clockwise direction reduces the torque, and in anti-clockwise direction increases the torque (viewed in the direction of the nut - figure 1).

EAS®-NC sizes 01–6 are adjusted generally at approx. 70%–75% of the corresponding max. torque and marked (calibrated) at the factory, if no other torque adjustment is required.

EAS®-NC sizes 03+02 must be adjusted as per the included adjusting diagrams, if there is no adjustment or calibration made at the factory.

Torque adjustment by the aid of the adjusting diagram

- Grease thread and contact faces of the adjusting nut, retaining ring and hub.
- Manually screw on adjusting nut (1) until contact is made with the cup springs (7).
- Continue turning until the 4 graduations (5) at the circumference of the adjusting nut (1) and the notches in the retaining ring (6) are in line with each other.
- Using a face wrench, turn the adjusting nut (1) through the number of graduations corresponding to the required torque (fig. 3) (number of graduations as per setting diagram).
- The graduations at the circumference of the adjusting nut (5) and retaining ring (6) must remain in the same position.
- Put Loctite 242 onto the retaining screw (2) and screw it into the adjusting nut (1).

Attention!!

After dismantling the clutch (e.g. by changing the cup springs or cup spring layers) the clutch must be re-adjusted.

- The limiting torque can be adjusted sensitively and indicated exactly by the fine pitch threaded graduated adjusting nut.
- The positive locking of the adjusting nut protects against selfacting unintended adjustment of the pre-set limiting torque. For EAS®-NC sizes 4–6 additional mechanical locking against blocking and backtwisting.

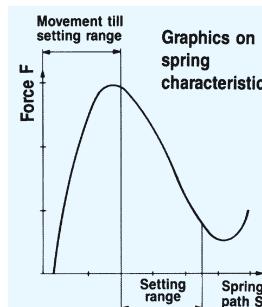

Fig. 2

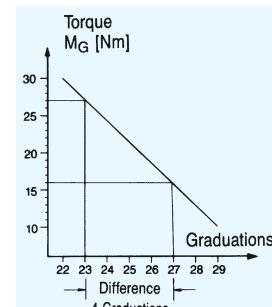

Fig. 3

Adjusting the torque

Remove the retaining screw (2) (for sizes 4–6, 4 setscrews) from the adjusting nut.

Turn adjusting nut clockwise or anti-clockwise with the use of a face wrench according to the engraved graduation (for sizes 03 and 02 setting diagram) until the required torque is set. The required torque is achieved when the graduation in the retaining ring and the indication on the percentage in the adjusting nut (for sizes 03 and 02 from the graduations on the adjusting diagram) are overlapped. Afterwards the retaining screw or setscrew, respectively (locking by Loctite 242) are screwed into the adjusting nut again, whereby the 4 graduations in the adjusting nut and retaining ring must remain in the same position.

Example:

Existing adjustment 65% of the max. torque.
The customer requires 90% of the max. torque.

Turn adjusting nut anti-clockwise, as described above, until 90% of the graduation are in line with the notches in the retaining ring. If necessary, the alignment of the notches at the circumference of the adjusting nut must be overlapped with the graduations of the retaining ring.

Manufacturer's declaration

The product is to be seen an option or component for installation into machines or equipment according to the machinery directive 98/37/EC.

The machinery (product) must not be put into service until the machinery into which it is to be incorporated has been declared in conformity with the provisions of the applicable EC directives.

The product complies to the low-voltage directive 73/23/EC.
There is no interference caused by the product according to the EMC regulation 89/336/EWG.

Safety regulations!

Hazardous conditions when contacting live leads and components.

Only qualified and well-trained specialists should work at the units to avoid any personal and material damages.

The installation and operating instructions have to be read carefully and the safety regulations have to be observed before installation and initial operation.

Limit switch Type 055.000.5 mechanical actuating

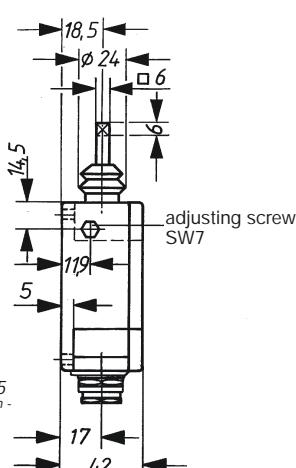

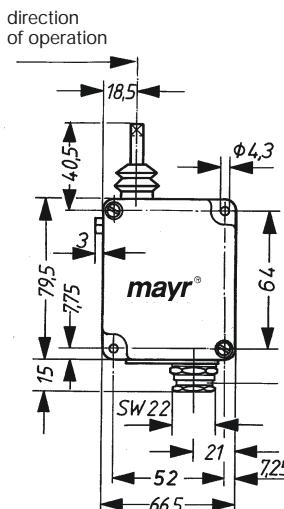

Application

- Monitoring of mechanical movements and final positions.
- Control switch for electronical and mechanical sequences.
- In connection with EAS[®]-products axial disengaging movements are monitored.

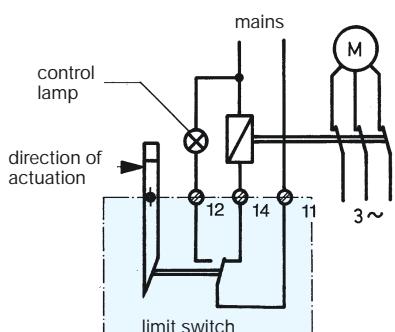

Design

The micro switch fitted into a light metal housing is actuated by a control lever. Operation is only possible in one direction. By actuating the control lever the pretensioned micro switch is unloaded: Opens contacts 11 – 14, closes 11 – 12. The limit switch is fastened via two screw-on brackets with 4 cap screws attached diagonally.

Type 055.002.5

Wiring diagram

NAMUR-transmitter undamped transmitting relay energised

NAMUR-transmitter damped transmitting relay de-energised

Design

The electronic amplifier is fitted into a light metal housing which can be attached via two diagonal fastening brackets with M4 cap screws. The transmitting relay is triggered during passing - **damped** - the sensor area of the NAMUR-transmitter with a metallic control flag, it gets currentless and is released. Contacts 2-3 are closed. Damping of the NAMUR-transmitter is possible from all sides.

When transmitting relay „currentless“ and contacts 2-3 closed:

- damping of the transmitter or
- no supply voltage or
- cable breakage of the NAMUR-transmitter

Technical data

Supply voltage	230 VAC +/-10 %, 50-60 Hz 115 VAC +/-10 %, 50-60 Hz 24 VDC +/-5 %, pole safe
Input	1,5 VA
Ambient temperature	amplifier -10 °C up to +60 °C NAMUR-transmitter -25 °C up to +60 °C
Protection	amplifier IP 54 NAMUR-transmitter IP 67
Max. connection cross section	2,5 mm ²
Transmitting relay	1 x change over contact, potential free load max. 230 VAC/5 Amp.
NAMUR-transmitter	to EN 50227 metal housing M 12 x 1 mm flush fitting switching distance SN 2 mm max. switching frequency 2 kHz
Weight	320 g

Type 055.001.5

External NAMUR-transmitter with a 2 m long cable (standard). Special lengths on request, possible max. 100 m.

Type 055.002.5

External NAMUR-transmitter fitted in the light metal housing. Lateral adjusting screw SW 7 for the adjustment of the zero point by 1 mm each.

Order example:

To be included when ordering, please state:	Type	Connected voltage
Order number:	0 5 5 . 0 0 _ . 5	_____

115 VAC		
24 VDC		

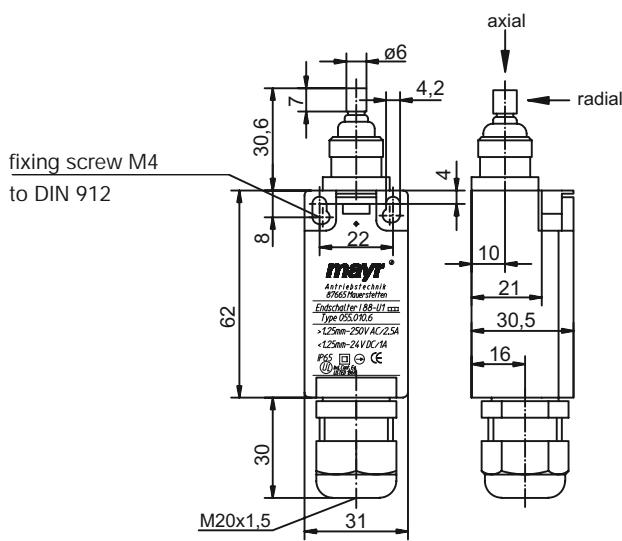

Example: Proximity limit switch with an external transmitter and a connected voltage of 230 VAC.

Order number: 055.001.5, 230 VAC

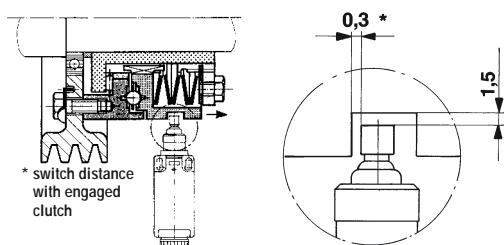

Limit switch Type 055.010.6 -universal operation-

Dimensions

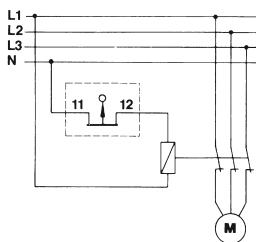

Assembly

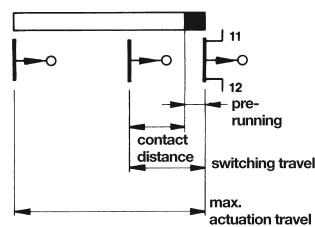

Attention! Do not fit switch in a dragging way and observe max. actuation travel (4 mm).

Switching example

Switching travel diagram

Application and Function

Monitoring of universal, mechanical movements and adjustments.
Suitable for clutches with a minimum stroke of

- 1,1 mm with radial actuation
- 0,9 mm axial actuation

By actuating the metal rod the contacts 11-12 are opened.
Zb: contacts separated by force, electrically disconnected.

Technical data

<input type="checkbox"/> Contact	1 x opener (Zb) -> automatic separation of the opener contact acc. to DIN 60947-5-1
<input type="checkbox"/> Contact opening	- after 0,2 – 0,4 mm with radial actuation - after 0,1 mm with axial actuation
<input type="checkbox"/> Load	opener-contact contact-distance > 1,25 mm = 250 VAC/2,5 Amp. contact-distance > 1,25 mm = 24 VDC/1Amp. (min. contact-distance 0,5 mm with 24 VDC)
<input type="checkbox"/> Max. current at make	acc. to EN 60947-5-1 AC 15 – control electromagnetic force DC 13 – control of electromagnets
<input type="checkbox"/> Max. actuating travel of the metal tappet	4 mm, axial or radial
<input type="checkbox"/> Switching frequency	max 100/min.
<input type="checkbox"/> Mech. service life	1 x 10 ⁶ hysteresis, unloaded
<input type="checkbox"/> Cable gland	M20 x 1,5
<input type="checkbox"/> Max. connection cross section	1,5 mm ²
<input type="checkbox"/> Ambient temperature	- 30 °C to + 80 °C
<input type="checkbox"/> Protection	IP 65
<input type="checkbox"/> Protection insulation	acc. to protection class II
<input type="checkbox"/> Housing	thermosplastic, self extinguishing to UL94-VO
<input type="checkbox"/> Weight	approx. 120 g

Delivery Programme

Safety clutches/ torque limiters

- EAS®-Compact/EAS®-NC**
Backlash-free, positive safety clutches
- EAS®-standard**
Positive safety clutch with backlash
- EAS®-overload/EAS®-elements**
Modular overload clutch for heavy duty applications
- EAS®-axial**
Overload protection for linear movements
- EAS®-Sp/EAS®-Sm/EAS®-Zr**
Pneumatically or electromagnetically controlled torque limiting clutches with ON/OFF control
- ROBA®-slip hubs**
Load holding, friction type safety clutches

Shaft couplings

- smartflex®**
Precision shaft coupling for servo applications, direct drive systems and stepping motors
- ROBA®-DX**
Backlash-free, torsionally rigid flexible steel bellows coupling
- ROBA®-ES**
Backlash-free and flexible for vibratory critical drives
- ROBA®-DS**
Backlash-free, torsionally rigid and shock-proof all-steel flexible coupling
- ROBA®-D**
Backlash-free, torsionally rigid all steel flexible coupling

Electromagnetic brakes/clutches

- ROBA-stop® safety brakes**
Electromagnetic spring applied safety brakes
- ROBA-stop®-M motor brakes**
Electromagnetic spring applied safety brakes
- ROBA-stop®-Z dual circuit fail safe brakes**
Double security or double braking torque
- ROBA®-quick brakes**
Electromagnetic pole face brakes
- ROBATIC®-clutches**
Electromagnetic pole face clutches
- ROBA®-takt**
Clutch brake units
