# ROTEX® Torsionally flexible couplings

## Description of coupling

ROTEX® - couplings are characterized by small dimensions, low weight and low mass moments of inertia yet transmit high torques. Running quality and service life of the coupling are improved by accurate all-over machining.

Their application is ideal for transmitting torque while damping torsional vibrations and absorbing shocks produced by the uneven operation of certain prime movers.

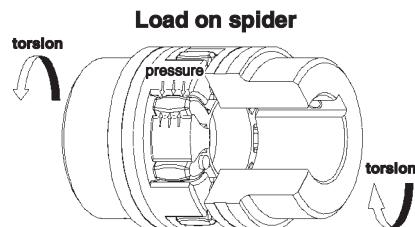

### General description

ROTEX® - couplings are torsionally flexible and designed for positive torque transmission. They are fail-safe. Operational vibrations and shocks are efficiently damped and reduced. The two congruent coupling halves with concave claws on the inside are peripherally offset in relation to one another by half a pitch. In addition, they are designed in such a way as to enable an involute spider to be located between them.

The teeth of the spider are crowned to avoid edge pressure if the shafts are misaligned.

ROTEX® couplings are capable of compensating for axial, radial and angular displacements of the shafts to be connected.

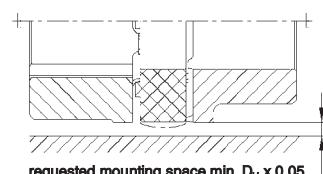

### Performance

In contrast to other flexible couplings, the intermediate members of which are subject to bending stress and are therefore prone to earlier wear, the flexible teeth of ROTEX couplings are subject to pressure only. This gives the additional advantage of the individual teeth being able to accept considerably higher loads. The elastomer parts show deformation with load and excessive speeds. Sufficient space for expansion should be ensured (see drawing – deformation with load).

The maximum torsion angle with ROTEX couplings of any size amounts to 5°. They can be fitted both horizontally and vertically.

### Deformation with load

### Explosion-proof use

ROTEX® couplings are excellently suitable for power transmission in drives in hazardous areas. The couplings are certified according to EC Standard 94/9/EC (ATEX 95) as units of category 2G and thus suitable for the use in hazardous areas of zone 1 and 2. Please read our information in the respective Type Examination Certificate and the operating and mounting instructions under [www.ktr.com](http://www.ktr.com).

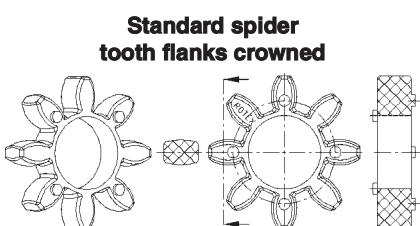

### Spiders

An operating temperature range of - 40° to + 100° C ensures perfect operation. Transient temperature peaks up to + 120° C do not cause any damage on the coupling. Continuous improvement of materials has resulted in a standard spider of 92 Shore A which offers various advantages over usual polyurethane materials. For higher torques it is also possible to make use of a spider 95/98 Shore A or 64 Shore D-F.

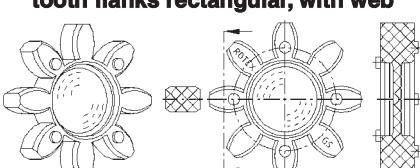

The spiders are extremely resistant to wear, oil, ozone and ageing.

In addition, they are resistant to hydrolysis (ideal for tropical climates).

The high internal damping protects the drive against dynamic overload.

## Spider types

### Spider types – Materials, physics, properties

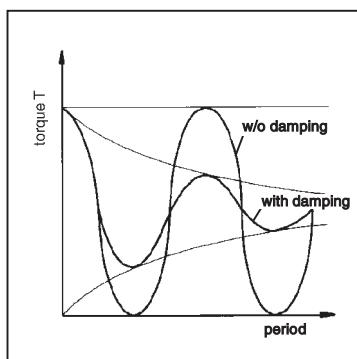

Standard spiders						
Spider type hardness-(Shore)	Identification colour	Material	Perm. temperature range (°C)		Available for coupling size	Typical applications
			Continuous temperature	Max. temperature short time		
92 Sh A	yellow	polyurethane	- 40 to + 90	- 50 to + 120	size 14 – 180	- for all applications in general engineering and hydraulics - Standard applications with average elasticity
95/98 Sh A	red	polyurethane	- 30 to + 90	- 40 to + 120	size 14 – 180	- good torque transmission with good damping properties
64 Sh D-F	natural white with green tooth flanks	polyurethane	- 30 to + 110	- 30 to + 130	size 14 – 180	- I.C. - engines - high air moisture, resistant to hydrolysis - displacement of critical speeds

### Spiders for special applications on request for:

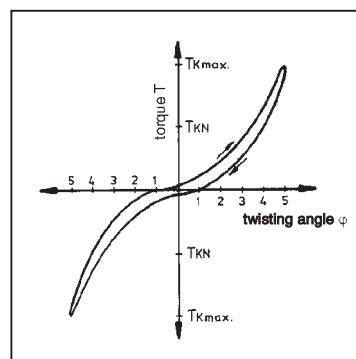

Typical applications	Spider type hardness (Shore)	Identification colour	Material	Perm. temperature range (°C)	
				Continuous temperature	Max. temperature short time
I.C.-engines, for high dynamic load, high air moisture/resistant to hydrolysis	94 Sh A-T	blue with yellow tooth flanks	polyurethane	- 50 to + 110	- 60 to + 130
Drives with higher loads, small twisting angles - torsionally rigid, high ambient temperatures	64 Sh D-H	green	hytrel	- 50 to + 110	- 60 to + 150
Small twisting angles and high torsion spring stiffness, high ambient temperature, good resistance to chemicals	polyamide	-	PA	- 20 to + 130	- 30 to + 150
Small twisting angles and high torsion spring stiffness, very high ambient temperature, good resistance to chemicals, resistant to hydrolysis	PEEK	light grey	PEEK	up to + 180 (ATEX release up to a max. + 160)	to + 250

# ROTEX® Torsionally flexible couplings

## Coupling selection

The ROTEX® coupling is selected in accordance with DIN 740 part 2. The coupling has to be dimensioned in a way that the permissible coupling load is not exceeded in any operating condition. For this purpose the actual loads have to be compared to the permissible parameters of the coupling.

### 1 Drives without periodical torsional vibrations

e. g. centrifugal pumps, fans, screw compressors, etc.

The coupling is selected taking into account the rated torques  $T_{KN}$  and maximum torque  $T_{K\max}$ .

#### 1.1 Load produced by rated torque

$$T_{KN} \geq T_N \cdot S_t$$

Taking into consideration the ambient temperature, the permissible rated torque  $T_{KN}$  of the coupling has to correspond at least to the rated torque  $T_N$  of the machine.

$$T_N [\text{Nm}] = 9550 \cdot \frac{P_{ANLN} [\text{kW}]}{n [\text{1/min}]} \quad (1)$$

#### 1.2 Load produced by torque shocks

The permissible maximum torque of the coupling has to correspond at least to the total of peak torque  $T_s$  and the rated torque  $T_N$  of the machine, taking into account the shock frequency  $Z$  and the ambient temperature.

$$T_{K\max} \geq T_s + T_N \cdot S_t \quad (2)$$

Drive-sided shock

$$T_s = T_{AS} \cdot M_A \cdot S_A \quad (3)$$

Load-sided shock

$$T_s = T_{LS} \cdot M_L \cdot S_L \quad (4)$$

$$M_A = \frac{J_L}{J_A + J_L} \quad M_L = \frac{J_A}{J_A + J_L} \quad (5)$$

This applies in case if the rated torque  $T_N$  of the machine is at the same time subject to shocks.

Knowing the mass distribution, shock direction and shock mode, the peak torque  $T_s$  can be calculated.

For drives with A. C.-motors with high masses on the load side we would recommend to calculate the peak driving torque with the help of our simulation programme.

**2. Drives with periodical torsional vibrations.** For drives subject to high torsional vibrations, e. g. diesel engines, piston compressors, piston pumps, generators, etc., it is necessary to perform a torsional vibration calculation to ensure a safe operation. If requested, we perform the torsional vibration calculation and the coupling selection in our company. For necessary details please see KTR standard 20004.

#### 2.1 Load produced by rated torque

$$T_{KN} \geq T_N \cdot S_t \quad (6)$$

Taking into account the ambient temperature, the permissible rated torque  $T_{KN}$  of the coupling has to correspond at least to the rated torque  $T_N$  of the machine.

#### 2.2 Passing through the resonance range

$$T_{K\max} \geq T_s \cdot S_t \quad (7)$$

Taking into account the temperature, the peak torque  $T_s$  arising when the resonance range is run through must not exceed the maximum torque  $T_{K\max}$  of the coupling.

#### 2.3 Load produced by vibratory torque shocks

$$T_{KW} \geq T_w \cdot S_t \quad (8)$$

Taking into account the ambient temperature, the permissible vibratory torque  $T_{KW}$  of the coupling must not be exceeded by the highest periodical vibratory torque  $T_w$  with operating speed.

For higher operating frequencies  $f > 10$ , the heat produced by damping in the elastomer part is considered as damping power  $P_w$ .

The permissible damping power  $P_{KW}$  of the coupling depends on the ambient temperature and must not be exceeded by the damping power produced.

Description	Symbol	Definition or explanation
Rated torque of coupling	$T_{KN}$	Torque that can continuously be transmitted over the entire permissible speed range
Maximum torque of coupling	$T_{K\max}$	Torque that can be transmitted as dynamic load $\geq 10^5$ times or $5 \times 10^4$ as vibratory load, respectively, during the entire operating life of the coupling
Vibratory torque of coupling	$T_{KW}$	Torque amplitude of the permissible periodical torque fluctuation with a frequency of 10 Hz and a basic load of $T_{KN}$ or dynamic load up to $T_{K\max}$ , respectively
Damping power of coupling	$P_{KW}$	Permissible damping power with an ambient temperature of $+30^\circ\text{C}$ .
Rated torque of machine	$T_N$	Stationary rated torque on the coupling
Peak torque of the machine	$T_s$	Peak torque on the coupling
Peak torque on the driving side	$T_{AS}$	Peak torque with torque shock on the driving side, e. g. breakdown torque of the electric motor

Description	Symbol	Definition or explanation
Peak torque of load side	$T_{LS}$	Peak torque with torque shock on load side, e. g. braking
Vibratory torque of machine	$T_w$	Amplitude of the vibratory torque effective on the coupling
Damping power of the machine	$P_w$	Damping power which is effective on the coupling due to the load produced by the vibratory torque
Moment of inertia of driving side	$J_A$	Total of moments of inertia existing on the driving or load side referring to the coupling speed
Moment of inertia of load side	$J_L$	
Rotational inertia coefficient of driving side	$M_A$	Factor taking into account the mass distribution with shocks and vibrations produced on the driving or load side
Rotational inertia coefficient of load side	$M_L$	$M_A = \frac{J_L}{J_A + J_L} \quad M_L = \frac{J_A}{J_A + J_L}$

## Coupling selection

Service factor  $S_t$  for temperature

	-30 °C +30 °C	+40 °C	+60 °C	+80 °C
$S_t$	1,0	1,2	1,4	1,8

Service factor  $S_z$  for starting frequency

starting frequency/h	100	200	400	800
$S_z$	1,0	1,2	1,4	1,6

Service factor  $S_A/S_L$  for shocks

	$S_A/S_L$
gentle shocks	1,5
average shocks	1,8
heavy shocks	2,5

### Permissible load on feather key of the coupling hub

In addition to the selection of the suitable material, the permissible load on the feather key has to be considered for the coupling selection.

Unless otherwise specified in your order, we will deliver the coupling in the material cast iron, quality EN-GJL-250 (GG 25).

In general engineering the following values are specified as permissible surface pressure in the feather key, each taking into account the material:

material cast iron EN-GJL-250 (GG 25) 120 N/mm<sup>2</sup>  
 material nodular iron EN-GJS-400-15 (GGG 40) 180 N/mm<sup>2</sup>  
 material steel S355J2G3 (St 52.3) 210 N/mm<sup>2</sup>

For steel 30 % less than the apparent yield point is supposed.

### Example of calculation of standard IEC motors shown on page 23:

#### Details of driving side:

A. C. motor	type 315 M
Motor output	P = 132 kW
Speed	n = 1485 1/min
Moment of inertia of driving side	$J_A = 2,9 \text{ kgm}^2$
Rated torque of driving side	$T_{AN} = 9550 \cdot \frac{132 \text{ kW}}{1485 \text{ 1/min}} = 849 \text{ Nm}$
Driving torque	$T_{AS} = 2,5 \cdot T_{AN}$ $T_{AS} = 2,5 \cdot 849 = 2122,5 \text{ Nm}$
Start-up frequency	$z = 6^{1/4}$
Ambient temperature	= + 60 °C

#### Details of load side:

Screw compressor	
Rated torque of load side	$T_{LN} = 800 \text{ Nm}$
Moment of inertia of load side	$J_L = 6,8 \text{ kgm}^2$

#### Coupling selection:

##### Load produced by rated torque:

$$\begin{aligned} T_{KN} &\geq T_N \cdot S_t \\ T_L &= T_{LN} \\ T_{KN} &\geq T_{LN} \cdot S_t = 800 \text{ Nm} \cdot 1,4 = 1120 \text{ Nm} \end{aligned}$$

Selected: ROTEX® size 90 - spider 92 Shore A with:

$$\begin{aligned} T_{KN} &= 2400 \text{ Nm} \\ T_{K\max} &= 4800 \text{ Nm} \end{aligned}$$

##### Load produced by torque shocks:

$$\begin{aligned} T_{K\max} &\geq T_S \cdot S_z \cdot S_t \\ T_S &= T_{AS} \cdot M_A \cdot S_A \\ T_S &= 2122,5 \cdot 0,7 \cdot 1,8 \\ T_S &= 2674,4 \text{ Nm} \\ T_{K\max} &\geq 2674,4 \cdot 1 \cdot 1,4 \\ T_{K\max} &\geq 3744 \text{ Nm} \end{aligned}$$

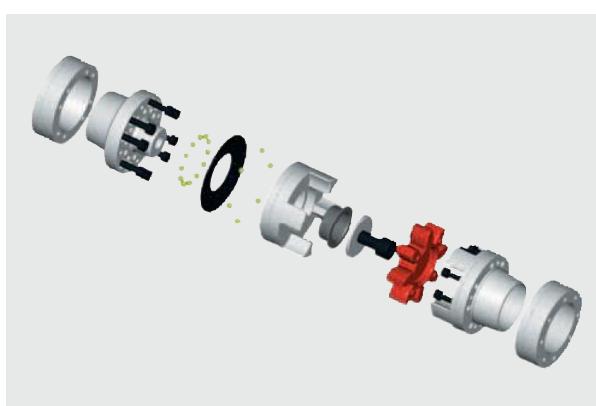

factors:

$$M_A = \frac{J_L}{J_A + J_L} = 0,7$$

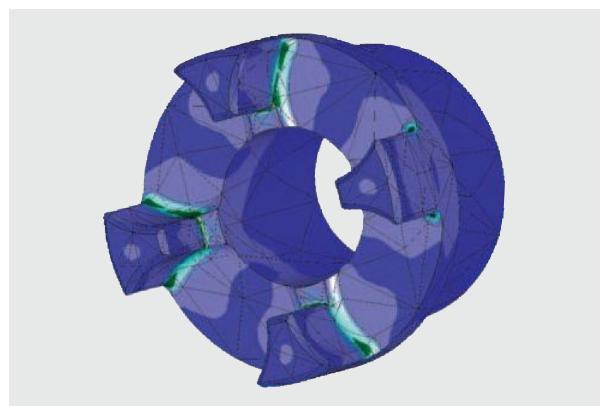

$$S_A = 1,8; S_z = 1; S_t = 1,4$$

Unless explicitly specified in your order, we will supply spiders with Shore hardness 92 A.

For peripheral speeds exceeding V = 30 m/sec., we would recommend only steel or nodular iron, respectively. Dynamic balancing required. 1) Hub material: EN-GJS-400-15 (GGG 40); steel

The arrangement of couplings is valid for an ambient temperature of up to +30 °C. For the selection there is a minimum safety factor of 2 of the max. coupling torque ( $T_{Kmax}$ ). A detailed arrangement is possible according to catalogue, page 20 and 21. Drives with periodical torque curves must be selected according to DIN 740 part 2. If requested, KTR will make the selection.

- 1) For dimensions see ROTEx® GS line
- 2) Motor hub from steel see page 25

# ROTEX® Torsionally flexible couplings

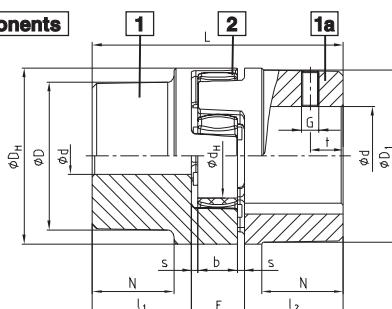

## Shaft coupling design No. 001 - casted materials

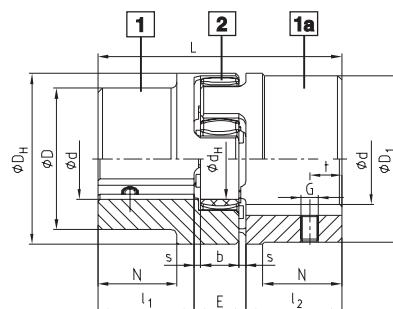

- Torsionally flexible, maintenance-free
- Damping vibrations
- Axial plug-in, fail-safe
- Allover machining – good dynamic properties
- Compact design/small flywheel effect
- Finish bore according to ISO fit H7, feather keyway according to DIN 6885 sheet 1 - JS9
- Basic programme/stock programme see pages 38 and 39
- Approved according to EC Standard 94/9/EC (without aluminium AL-D)
- Mounting instructions under [www.ktr.com](http://www.ktr.com)

Tyre couplings

- Assembly/disassembly by means of 4 screws only
- Exchange of spider with no need to shift the driving and driven side (motor and pump)
- Positive-locking and frictionally engaged hub combinations to be assembled radially (dimension E1 of design AFN = dimension E1 of A-H)
- Finish bore according to ISO tolerance H7, feather key according to DIN 6885 sheet 1 - JS9
- Please order our separate dimension sheet (M425460)
- Approved according to EC Standard 94/9/EC (Explosion Certificate ATEX 95)
- Mounting instructions under [www.ktr.com](http://www.ktr.com)

## Flange programme

### Designs CF a. CFN No. 005 and DF a. DFN No. 006

- Flange designs applicable to heavy machinery
- CF and CFN - connection flange to shaft
- DF and DFN - double flange design for the connection of driving and driven machine, radial assembly possible without removal of other components, allowing for a quick replacement of spider
- CFN and DFN - particularly small outside diameters
- DF and DFN – compact design
- DFN - for customer-specific mounting flanges
- Flange material part 3b: EN-GJS-400-15 (GGG 40)
- Finish bore according to ISO fit H7, feather keyway according to DIN 6885 sheet 1 - JS9
- Approved according to EC Standard 94/9/EC (Explosion Certificate ATEX 95)

## Double cardanic – the innovation in pump design

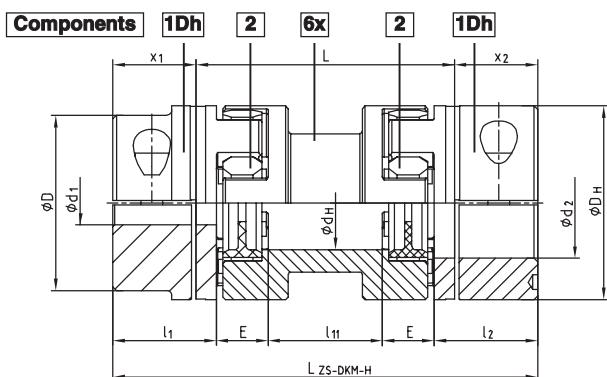

### Type ZS-DKM-H

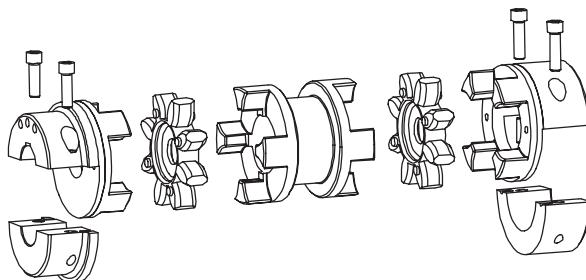

ROTEX  
POLY-NORM  
POLY  
REVOLEX KX  
Tyre couplings

- Standard spacers up to 250 mm shaft distance dimension – ex stock
- Assembly/disassembly through 4 screws only
- Compensates for high shaft displacements due to double-cardanic design
- Remains torsionally symmetric in case of shaft displacements
- Reduced vibration and noise
- Low restoring forces → Increase of the total lifetime of all adjacent components (bearings, seals etc.)
- Finish bore according to ISO fit H7, feather keyway according to DIN 6885 sheet 1 - JS9
- Approved according to EC Standard 94/9/EC (Explosion Certificate ATEX 95)
- Mounting instructions under [www.ktr.com](http://www.ktr.com)

Double-cardanic – the innovation in pump design

Type DKM No. 018

- For high shaft displacements
- 3-part double-cardanic
- Reduced vibration and noise
- The restoring forces resulting from displacements are very low
- Increase of the total lifetime of all adjacent components (bearings, seals etc.)
- Finish bore according to ISO fit H7, feather keyway according to DIN 6885 sheet 1 - JS9
- Approved according to EC Standard 94/9/EC (Explosion Certificate ATEX 95)
- Mounting instructions under [www.ktr.com](http://www.ktr.com)
- Double-cardanic design without the need for bearing support or external guarding

Intermediate shaft programme

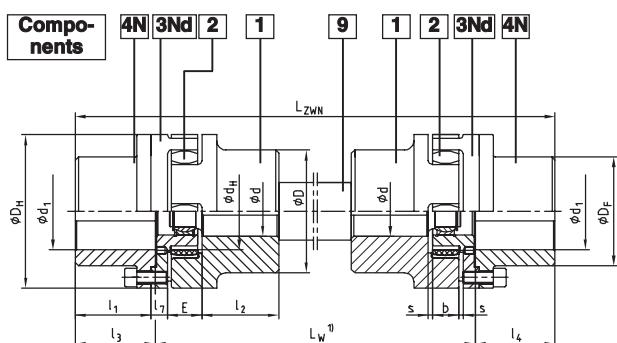

Designs ZWN No. 017 and ZR No. 037

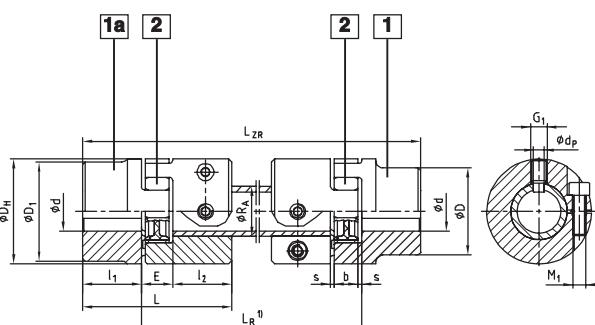

ROTEX  
POLY-NORM  
POLY  
REVOLEX KX  
Tyre couplings

- To connect shaft ends with extended shaft separations
- Double cardanic - thus able to compensate for high radial misalignments
- Good damping properties by the arrangement of two spiders
- Radial assembly possible without displacement of the driving or driven machine
- Design ZWN - intermediate shaft centered via the spherical plain bearings
- Design ZR - flexible within the GS spider - intermediate pipe with bearings, to be disassembled radially
- Designs ZWN and ZR - modification for customers from the stock programme
- Finish bore according to ISO fit H7, feather keyway according to DIN 6885 sheet 1 - JS9

# **ROTEX® Torsionally flexible couplings**

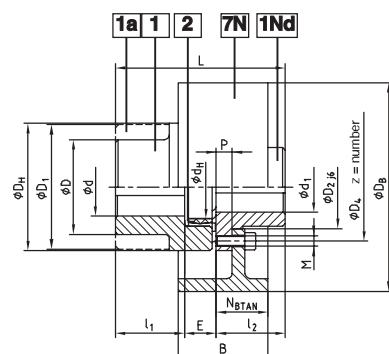

## **Brake drum/Disk brake**

# **Designs BTAN No. 11 and SBAN No. 013**

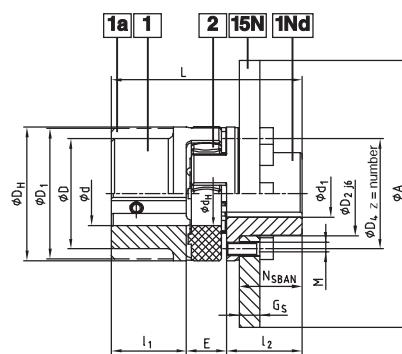

- Shaft coupling BTAN with brake drum to be mounted to external drum brakes with double shoes according to DIN 5431/15435
  - Shaft coupling BTAN with disk for braking calipers
  - Each coupling type to be combined with various sizes of brake drum disks (see dimension "N")
  - The brake drum or disk brake has to be placed onto the shaft end with the biggest mass moment of inertia
  - The maximum brake torque must not exceed the maximum torque of the coupling
  - Designs BTAN and SBAN - modification for customer from the stock programme
  - Finish bore according to ISO fit H7, feather keyway according to DIN 6885 sheet 1 - JS9
  - Mounting instructions under [www.ktr.com](http://www.ktr.com)

# ROTEX® Torsionally flexible couplings

Shiftable at standstill

Design SD No. 015

- Shiftable shaft coupling for all applications in general engineering
- Easy to engage and disengage driving or driven machines with standstill of machine
- Existing shifting hub to be combined with slip ring and shiftable linkage
- With pilot bored shifting hubs the requested shifting force must be set after final machining
- Other sizes on request according to M 370266
- Complete shifting device consisting of: separated slip ring from red bronze, shift fork, shifting shaft, shifting lever, eye type bearing
- Finish bore according to ISO fit H7, feather keyway according to DIN 6885 sheet 1 - JS9

# ROTEX® Torsionally flexible couplings

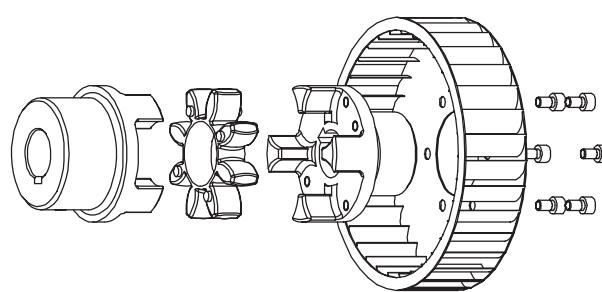

## Designs FNN No. 021 and FNN with fan

- Damping vibrations and reducing noise
- Ideal compensation for misalignment due to crowned teeth
- Coupling as plug-in design
- Easy checking of wear by sight control
- Coupling to be equipped with any fan
- Finish bore according to ISO fit H7, feather keyway according to DIN 6885 sheet 1 - JS9

Other sizes on request

### Type 1: Fan screwed on

The ROTEX® coupling can be supplied with the fan screwed on. Specific connection dimensions of customers such as pitch circle of threads, size of threads and number of centering of fans should be mentioned in your inquiry.

### Type 2: Fans injection-moulded

Low prices due to production volumes depending on quantity.

### Type 3: Fans pressed or glued on

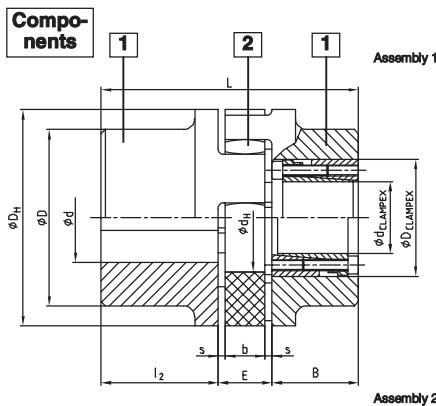

Special surface forming (knurling according to DIN 82) allows the fan to be pressed or glued onto the hub collar.

Preferred designs: ■ Type 1.3 hub with spline bore/for end plate/with recess

● Type 2.3 clamping hub with spline bore

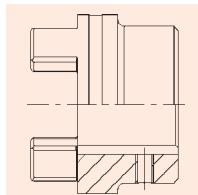

# ROTEX® Torsionally flexible couplings

## Hub designs

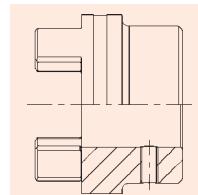

Due to the numerous applications of ROTEX® for many different mounting situations, this coupling system is available with various hub designs. These designs mainly differ in that they offer either positive or frictionally engaged connections, but mounting situations like, for example, gear shafts with integrated transmission cams or similar applications are covered, too.

### Design 1.0 hub with keyway and fixing screw

Positive power transmission; permissible torque depends on the permissible surface pressure. Not suitable for backlash-free power transmission for heavily reversing operation.

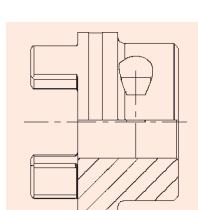

### Design 1.1 hub without feather key, with setscrew

Positive torque transmission for connections pressed or glued in. (No ATEX release)

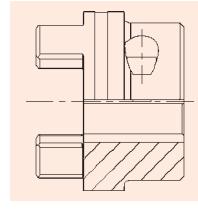

### Design 1.3 hub with spline bore (page 39)

### Design 2.0 clamping hub, single slotted, without keyway

Frictionally engaged, backlash-free shaft-hub-connection. Transmittable torques depend on the bore diameter. (Only for ATEX category 3)

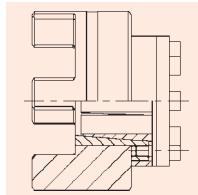

### Design 2.1 clamping hub, single slotted, with keyway

Positive power transmission with additional frictional tightness. The frictional tightness avoids or reduces reversal backlash. Surface pressure of the keyway connection is reduced.

### Design 2.3 clamping hub with spline bore (page 39)

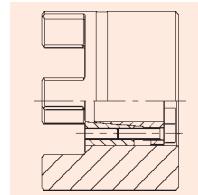

### Design 4.2 with CLAMPEX® clamping set KTR 250

Frictionally engaged, backlash-free shaft-hub-connection for transmission of average torques.

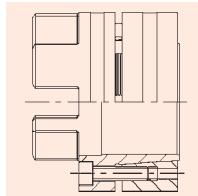

### Design 4.1 w. CLAMPEX® clamping set KTR 200/

### f. KTR 400 Ausf. 4.3

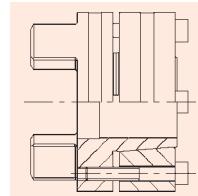

Frictionally engaged, backlash-free shaft-hub-connection for transmission of larger torques. Largest clamping set possible depends on the hub collar diameter. Clamping set screw fitting possible both internally and externally. For details of calculation please see CLAMPEX® catalogue.

### Design 6.0 clamping ring hub (see ROTEX® GS series)

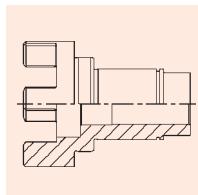

Integrated frictionally engaged shaft-hub-connection for transmission of higher torques. Screw fitting on elastomer side. For details about torques and dimensions see ROTEX® GS catalogue on page 106. Suitable for high speeds.

### Design 6.5 clamping ring hub

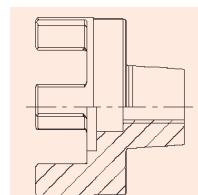

Design equal to 6.0, but clamping screws to be fitted externally. Suitable, for example, for disassembly of radial spacer tubes (special design).

### Special hubs on request

Special lengthened hub/shaft with integrated cams.

### Special hubs on request

Special hub with external taper as a frictionally engaged connection.

### Displacements

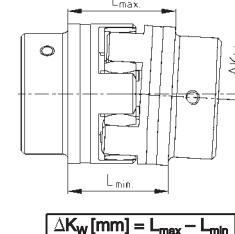

#### Axial displacement ΔKa

#### Radial displacement ΔKr

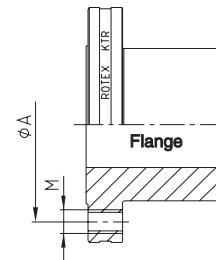

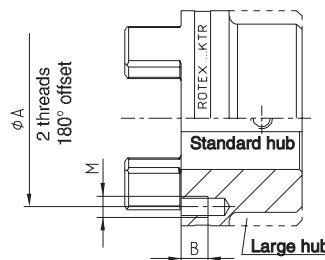

#### Angular displacement ΔKw [degrees]

$$\Delta K_w [mm] = L_{max} - L_{min}$$

The above-mentioned figures of displacement of flexible ROTEX® couplings are standard values taking into account the load of the coupling up to the rated torque T<sub>Kw</sub> and an operating speed n = 1500 1/min along with an ambient temperature of + 30° C. For different operating conditions please order our data sheet KTR-N 20240 regarding displacements for ROTEX®. The displacement figures may only be used one by one - if they appear simultaneously, they must be limited in proportion. Care should be taken to maintain the distance dimension E accurately in order to allow for axial clearance of the coupling while in operation. In case of an axial shifting the dimension "L" has to be considered as a minimum dimension in order to keep the spider free from pressure on its faces. Detailed mounting instructions are shown on our homepage (<http://www.ktr.com>).

### Fixing screws/Pull-off threads

Standard hubs with pull-off threads are produced on request only.

Standard flanges up to size 90 with 2 pull-off threads, from size 100 with 3 pull-off threads.

### Fixing screws to DIN EN ISO 4762 for couplings with brake drums or disk brakes, spline clamping hubs

Cap screw DIN EN ISO 4762 – 12.9
